PIXION

Turning space into media,

AIoT Lighting Signage

Built on the lighting infrastructure you already have, it turns floors and walls into advertising media without touching the interior.

Unmissable visibility

Moving graphics at over 1,000 lux on the floors and walls where customers are already looking.

Clip on, run from an app

Clip it onto a lighting track and installation is done. Head office updates every store at once from the app.

Install once, stay fresh

No more reprinting. Swap the content, not the hardware, and take the device along when the store moves.

At their feet, not at eye level

Three things combine to stop people mid-stride.

Impossible to ignore

Light on the walking path cannot be avoided. Entrances, checkouts, queues: wherever people stand becomes the ad surface.

Crisp at 1,000 lux

Clearly legible in most indoor stores without direct sunlight.

※ At a projection distance of 2.5 m

Motion graphics

Unlike static print, motion holds the eye, then guides the customer where you want them to go.

From installation to operation in three steps

1

Install

Clip it onto a lighting track or fix it with a bracket, then connect the power.

2

Register in the app

The smartphone app finds the device and connects it to the store Wi-Fi. This step can be delegated to an installer.

3

Upload content

Set when each video or image should appear and push it to the devices.

Don't reprint it.

Not just a device that plays video, but a system that takes the hassle out of running stores.

Zero cost, zero waste

No printing, shipping or staff to swap posters, banners and POP, and nothing to throw away when the campaign ends.

Every store, one place

No per-store print runs. Swap content across all stores at once for events and seasons, centrally and without a site visit.

Reuse anywhere

Change content every season or event. If the store moves or the layout changes, unclip the device and use it again as is.

Where it works

Retail
Guides foot traffic from the entrance and replaces POP displays

Exhibitions
Replaces every piece of print made for a short event and discarded afterwards

Hospitality
Spatial staging and branding for museums, galleries, hotels, resorts and pop-up stores

Public & transit
Wayfinding in public buildings, stations and airports, and dynamic evacuation guidance in emergencies

Key features

Remote management
Manage the devices in every store from one screen and run them together.

Presence detection
Turns the display on only when someone is there, saving energy.

Content scheduling
Content changes automatically at the times you set.

Operations report
A daily email reports uptime and any faults.

Uninterrupted playback
If the internet drops for a while, playback continues from stored content.

Automatic updates
Improvements are delivered remotely, so no site visit is needed.

Installation options

Track-mounted

Clips straight onto the lighting track found in most stores. Powered from the track, with no extra wiring.

Stand-alone

Where there is no track, mount it on a ceiling or wall with a bracket or a 1/4" tripod mount. Powered by an adapter.

Image coming soon

Shelf-mounted

Expected late 2027

A very small unit under a display shelf projects onto the floor in front of it, right at the point of purchase.

Specifications

※ May change in mass production.

Environment	Indoor, throw up to 3 m (2.5 m optimal)
Track	Standard 220 V single-circuit track
Power	Track power or DC 24 V adapter
Content	Video and image files, auto-converted
Connectivity	Wi-Fi; Bluetooth for initial setup
Operation	Multiple devices from the PIXION app
